                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          5583
                                              CC Novel hybridisation assay probes have been developed comprising an CC oligonuclectide which will hybridise under selected conditions to Human CC papillomavirus (HPV) Type 16 and/or 18 (but not Types 6, 11, 31, 33, 35, CC 39, 45, 51, 52, or 58) target nucleic acids to form detectable target: CC probe duplex. The present sequence represents a specifically claimed HPV CC probe. Oligonuclectides are useful to detect HPV Type 16 and/or 18 in CC samples e.g. cervical smears, body fluid, and distinguish these from CC other HPV variants. Papillomaviruses are small DNA viruses and HPV Types 16 and/or 18 mucleic acid in a sample. HPV Type 16 and/or 18 mucleic acid in a sample. HPV Type 16 and/or 18 can be detected by adding a probe and detecting probe:target CC duplex formation; target nucleic acid is optionally amplified. Type 16 cone specifically detected by amplifying nucleic acids with at least CC one specifically claimed PCR primer. For Type 18 detection, a helper CC probe may be used. Oligonucleoted acid is whilst available detection CC sera react with antigens of all papillomaviruses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                       The invention relates to a novel immortalized endometrial glandular epithelial cell strain in which an exogenous immortalizing gene is introduced and the properties of the cell line as non-cancer typical glandular epithelial cells, are maintained. The cell line of the invention may be useful for research of reproduction, particularly for analyzing the adhesion of the fertilized egg during implantation, analyzing the effect of steroid hormones, analyzing the mechanism of multistep canceration of the inner glandular epithelial membrane by genetic engineering of the cell line which is otherwise non-cancerous, and analyzing the effect of carcinogenic substances on the cell line. The cell line maintains the properties of normal somatic cells and the properties of endometrial glandular epithelial cells. The current sequence is that of the Human papillomavirus type 16 86 deltais1 mutant that is the invention.

A complex of the invention has virucide and cytostatic activity, and may have a use as a vaccine. The complex is useful for identifying agents for treating or preventing a conditions involving altered level of the complex, e.g. human papilloma virus (HPV) infection, or cancer. The compositions, antibodies, vectors and methods are useful for treating such diseases. The sequences shown in ADF09584-ADF09697 represent cDNA's of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a novel method for selective post-translational CC silencing in a mammalian cell of the expression of an exogenous gene of CC viral origin. The method comprises introducing into the cell a small CC interfering RNA (siRNA) construct that is homologous to a part of the CC mRNA sequence of the gene. The method is useful for the selective post-cc transcriptional silencing of an exogenous gene of viral origin (e.g. an CC compose or human papilloma virus (HPV) gene) in a mammalian cell. The CC method or the siRNA is particularly useful for treating cancer, human CC cervical cancer, human immunodeficiency virus (HIV), smallpox, flu, CC common cold, or a disease caused by a HPV (e.g. genital warts, cervical cancer, penile cancer, malignant squamous cell carcinomas or verruca CC vulgaris). An siRNA construct or vector is useful for use as a medicament CC content of the diseases mentioned. The polynucleotide sequence of the invention CC can be used to treat disorders by gene therapy. This polynucleotide content of the invention CC can be used to treat disorders by gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

The cell line of the invention may be useful for research of reproduction, particularly for analyzing the adhesion of the fertilized egg during implantation, analyzing the effect of steroid hormones, analyzing the mechanism of multistep canceration of the inner glandular epithelial membrane by genetic engineering of the cell line which is otherwise non-cancerous, and analyzing the effect of carcinogenic substances on the cell line. To cell line maintains the properties of normal somatic cells and the properties of endometrial glandular epithelial cells. The current sequence is that of the Human papillomavirus type 16 E6 wild-type gene

A variant of the human papilloma virus (HPV) 86 or 87 protein which elicits a humoral and/or cellular immune response against HPV can be used in vaccines against HPV or to treat HPV infection. The variant is preferably a deletion mutant comprising at least half, and preferably two-thirds of full length 86 or 87 protein starting from the N- or C-thirds of full length 86 or 87 protein starting from the N- or C-thirds of starting from the N- or C-thirds of starting from the N- or C-thirds of full length 86 moiety fused to a full length 87 moiety.
                                                                     Vaccine variants of human
E6 and/or E7 protein, pref
prevent HPV infection.

     A variant of the human papilloma virus (HPV) E6 or E7 protein which elicits a humoral and/or cellular immune response against HPV can be used in vaccines against HPV or to treat HPV intection. The variant is preferably a deletion mutant comprising at least half, and preferably two thirds of full length E6 or E7 protein starting from the N- or C-terminal, or is a full length E6 moiety fused to a full length E7 moiety. The variant optionally has a linkage moiety and a foreign protein or peptide which facilitates the purification of, and enhances the immunogenicity of, the fusion protein. This sequence encodes a fusion between the C-terminal end of E7 and the N-terminal end of E6. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The variant optionally has a linkage molety and a foreign protein or peptide which facilitates the purification of, and enhances the immunogenicity of, the fusion protein. This sequence encodes a fusion between the C-terminal end of E and the N-terminal end of E7. The protein is also a deletion mutant generated from the sequence describ in AAT31833.                                                                                                              The sequences of the E6 and E7 polypeptide-encoding regions of human papillomavirus (HPV) 16 and 18 are given in AQ75470-71 and the encoded proteins in AAR63865-66, respectively. Probes and primers based on these sequences were used for HPV infection diagnosis; expression of E6 and E7 is diagnostic for cervical cancer or pre-malignant states. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 16-OCT-2003 to standardise

                                                                                                                           The patent is for a rapid in situ hybridisation assay for detecting and typing human papilloma virus (HPV) in non-frozen cellular smears fixed to a support in absence of aldehyde-based crosslinking reagents. The assay comprises: (1) combining nucleic acid in the sample with at least one detectable probe able to hybridise with 1 or more HPV types; and (2) detecting presence or absence of hybrid complexes. Opt. several probes are used, eg one for HPV types 6 and 11, associated with benign warts, and one for types 16, 18, 31, 33 and 35, associated with cervical cancer. The assay can differentiate between HPV types. It is esp. used as a secondary test. The probes can be synthesised or cloned. (Updated on 27-AUG-2003 to correct OS field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC A dengue virus recombinant replicon has a deletion of the complete coding CC sequence for preM protein of dengue virus and also includes elements of CC e.g. the non-coding region in the whole of the 5'-end, the coding region CC of the front 20 amino acids in the C protein, and the coding region of CC obtained vaccines are useful in producing preventives or/and remedies for CC cancer like cervical cancer and viral diseases. Such vaccines can CC efficiently express antigen in infected cells, which is because dengue CC virus can infect dendritic cells, and can effectively present antigen to CC provide immunity effect. Different types of dengue virus can be used to CC repeatedly produce efficient immune response thereby strengthening the CC capter immune system against the pathogen that contains such antigen. CC Human papillomavirus (HPV) vaccines were prepared by using a gene-CC expressing system using of the full-length dengue virus cDNA clone (CC provide) (BHX) cells to enable the screening of BHX-21 Tet-off cell lines. This sequence corresponds to the HPV type 16 E7 gene used as the CC gene of interest in the recombinant replicon of the invention.

The DEN replicon contains exogenous nucleoties such as human papillomavirus (HPV) antigen proteins, immune regulators or combination of HPV antigen and immune regulators. The invention is useful for producing a drug for the prophylaxis and treatment of cancer or viral

Human papilloma virus; HPV; detection; cervical cancer; amplification;

E6/E7 region of Human Papilloma Virus 16 (HPV 16).

Ś 멹

```
An in situ hybridisation assay for detecting an intracellular marker of low copy number in cells comprises fixing the cells to a support using paraformaldehyde; treating the cells with a protease to permeabilise them without altering morphology; adding amplification reagents; incubating the cells at below fifty degrees celeius to perform amplification by self—sustained sequence replication; adding a labelled probe complementary to the region between the primers; washing cells to remove unhybridised probe and then detecting the labelled probe. The E6/E7 region of human papilloma virus (HPV) 16 is used especially to detect mRNA being transcribed from this region which becomes active in transformed cells. The method can be used for the early diagnosis of cervical cancer. Primers used to amplify fragments of the E6/E7 region are described in AAT14664-T14674. (Updated on 25-AMR-2003 to correct PF field.) (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                               Detection of low copy number intracellular markers - of target RNA in fixed cells then hybridisation with detecting human papilloma virus in cervical cells.
                                                                                                                                                                                                         Example 2; Fig 3; 21pp; English.

27-AUG-2003
                                                                                                                                This nucleotide probe is specific for the HPV16 Human Papilloma Virus (HPV) gene. The degree of HPV infection can be assessed, by measuring levels of expression of genes involved in the diseased state, and comparing the expression to each other or to reference genes. (Updated 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                 Disclosure; Fig 5; 35pp; English.

                                                                                                                                 The fragment of DNA contg. the HPV-16 B6/E7 coding region was prepd. by PCR from plasmid pBR322/HPV16 (Durst et al., PNAS, 80: 3812 (1983)) using oligonucleotides SO5 and SO6. The DNA prod. has a site for Nco1 at the beginning of the E6 gene and a Smal site immediately downstream of the termination codon for E7. The B6 and E7 ORFs are fused together to form a single continuous ORF via site directed mutagenesis and the immortilising potential of E7 is removed by altering two key codons of the HPV E7 sequence. The single ORF of HPV-16 B6/E7 may be inserted into vaccinia virus DNA at neutral sites (pref. by inserting two sets of the DNA in opposite orientations to overcome the problem of intertypic recombination) to make a recombinant virus vector for use immunotherapeutically to activate cells of the immune system against HPV.                                                                                                                                             A variant of the human papilloma virus (HPV) E6 or E7 protein which elicits a humoral and/or cellular immune response against HPV can be used in vaccines against HPV or to treat HPV infection. The variant is preferably a deletion mutant comprising at least half, and preferably two thirds of full length E6 or E7 protein starting from the N- or C-thirds of full length E6 or E7 protein starting from the N- or C-terminal, or is a full length E6 moiety fused to a full length E7 moiety. The variant optionally has a linkage moiety and a foreign protein or peptide which facilitates the purification of, and enhances the immunogenicity of, the fusion protein. This sequence encodes a full length E6/E7 fusion protein. (Updated on 27-AUG-2003 to correct OS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     27-AUG-2003

These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonucleotide. The products of the invention can be used to induce ar immune response in a patient to an HPV antigen. They can also be used if preventing or treating HPV induced tumours

The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for immuno-therapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae Lyra protein (20-127), the C-terminus of Streptococcus pneumoniae Lyra protein (CLyra) or thioredoxin. The present sequence encodes an HPV-H. influenzae D protein, fusion protein of the
                                                                                                                                                                                                        AAX78791-X78801 represent nucleic acid sequences which encode novel constructs comprising an E6 or E7 protein or E6/E7 fusion protein from HPV (represented in AAX75375-Y25386). These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonucleotide. The products of the invention can be used to induce an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 822
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 4; Fig 3; 96pp; English.

                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents the coding region for a chimeric E6 or E7 protein or E6/E7 fusion protein from Human papillomavirus (HPV) linked the an immunological fusion partner, in this case, a fragment of the streptococcus pneumoniae CLYTA protein. The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for immuno-therapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection.                                                                                                                                                                                                                                                                                                                                                               The invention relates to human Papilloma virus (HPV) fusion proteins, linked to an immunological fusion partner that provides T helper epitopes to the HPV antigen. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae Lyth protein (CLyth) or thioredoxin. The present sequence encodes an HPV-Lyth, fusion protein of the invention.

The invention calls containing it, are used in treatment and prevention of cervical cancer, particularly as a vaccine. By selecting the nucleic acid that encode 86/87 proteins without ability to bind to pkb and p53, the risk that cells infected with the alphavirus vector system may become oncogenic is avoided (contrast use of other viral vectors). The present

These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonucleotide. The products of the invention can be used to induce an immune response in a patient to an HPV antigen. They can also be used for preventing or treating HPV induced tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAX78793;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents the coding region for a chimeric E6 or E7 protein or E6/E7 fusion protein from Human papillomavirus (HPV) linked t an immunological fusion partner, in this case, a fragment of the Haemophilus influenzae B protein D. The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for immuno-therapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human Papilloma virus (HPV) fusion proteins, linked to an immunological fusion partner that provides T helper epitopes to the HPV antigen. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae Lyth protein (CLyth) or thioredoxin. The present sequence encodes an HPV-H. influenzae D protein, fusion protein of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  constructs comprising an E6 or E7 protein or E6/E7 fusion protein from HPV (represented in AAY25375-Y25386). These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonucleotide. The products of the invention can be used to induce an immune response in a patient to an HPV antigen. They can also be used fo preventing or treating HPV induced tumours
                                                                                                                         This sequence represents the coding region for a chimeric E6 or E7 protein or E6/E7 fusion protein from Human papillomavirus (HPV) linked to an immunological fusion partner, in this case, a fragment of the Streptococcus pneumoniae CLYTA protein. The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for immuno-therapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 1173 BP; 380 A; 229 C; 276 G; 288 T; 0 U; 0 Other;

                                                                                                                The invention relates to human Papilloma virus (HPV) fusion proteins, linked to an immunological fusion partner that provides T helper epitopes to the HPV antigen. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an E6-E7 fusion or mutatted) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptcoccus pneumoniae Lyth protein (CLyth) or thioredoxin. The present sequence encodes an HPV-Lyth, fusion protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Fusion protein; vaccine; papilloma;

The ribozymes cleave HPV to lower the production of the E6 and E7 proteins which play a key role in keratinocyte transformation. They can be used for the treatment of HPV infections which are associated with genital warts and genital neoplasms. In particular they can be used for the cervical cancer optionally with other agents such as cisplatin. Ribozymes are described in AAT40306-T40315. (Updated on 27-AUG-2003 to correct OS

Methods have been developed for distinguishing a subset of human CC papilloma virus (HPV) that is associated with an increased risk of developing cervical (HPV) that is associated with an increased risk of CC (1) preparing a cervical sample or cervical cancer. The methods involve: CC (1) preparing a cervical sample to expose any HPV-16 E6 gene in the CC sample and determining if the base at position 350 of the B6 gene (see CC AAT94723 and AAT94724 for comparison) is T or G, where the presence of GC at position 350 is associated with an increased risk of developing CC cervical dysplasia or cervical cancer; and (2) preparing a cervical sample to expose any HPV-16 E6 protein in the sample and determining if CC the amino acid at position 83 of the protein (see position 90 in AAW35741 CC and AAW35742 for comparison) is Val or Leu, where the presence of Val at CC position 83 that is associated with an increased risk of developing CC cervical dysplasia or cervical cancer. The present sequence represents CC correlates well with Pap scores; 3507:350G ratios among 45 HPV16 samples CC were 10.4 for negative Pap scores; 4:2 for CIN I, 1:6 for CIN III; 2:9 for CIN III; 0:3 for cancer. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sa

                                                                                                                                      This sequence represents a sequence from the HPV-16 genome. This invention relates to antisense oligonuclectide analogs (ONs) that have a sequence complementary to a sequence of nucleotides 415-445 of human papilloma virus-16 (HPV-16). The antisense ONs can be used to inhibit expression of HPV gene E6/E7 in living cells, preferably human keratinocytes or human cervical cells. They bind to E6/E7 mRNA in the cell, prevent mRNA translation and promote mRNA degradation by intracellular RNase H. They can be used for preventing transformation of living cells by HPV. The antisense ONs are used particularly for inhibiting the growth of cervical tumours. (Updated on 17-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 7904 BP; 2601 A; 1377 C; 1509 G;

                                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                                                                    This is the nucleotide sequence of the genome of the Human papillomavirus 16 used in the method of the invention involving human involucrin (hINV), in the production of a nucleotide sequence comprising the promoter sequences of the hINV gene. It can be used to direct the expression of nucleic acids in epithelial cells, particularly suprabasal epithelial cells. The nucleotide sequence can be used with human papillomavirus (HPV) oncogenes for producing transgenic animals which display cervical and epidermal hyperplasias as well as cancer of the traches, esophagus, colon, epidermis, anus/rectum, lymph nodes, spleen and lung. These animals provide useful models for the identification of potential carcinogens and co-carcinogens, identification of anti-neoplastic compounds, identification of genes which play a role in neoplastic progression of cancers of the trachea, esophagus, colon, epidermis, anus/rectum, lymph nodes, spleen, lung and cervix. The products can also be used for producing antisense molecules which can be used for reducing or preventing expression of a gene whose expression is controlled by the
                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This is the nucleotide sequence of the human papilomavirus 16, involved CC in the method of the invention where the involucorin (hinv) gene is expressed by a transgenic non-human animal. The nucleotide sequence comprises the promoter of the hinv gene which directs the expression of nucleic acids in epithelial cells, particularly suprabasal epithelial cells. In particular when the NS directs the expression of oncogenes such as human papillomavirus (HPV) 16 oncogenes in transgenic animals, the animals display cervical and epidermal hyperplasias as well as cancer of the trachea, esophagus, colon, epidermis, anus/rectum, lymph nodes, colon, epidermis, anus/rectum, lymph nodes, colon, epidermis and co-carcinogens, colon, epidermis and co-carcinogens, colon, epidermis, anus/rectum, lymph nodes, esophagus, colon, epidermis, anus/rectum, lymph nodes, and co-carcinogens, colon, epidermis, anus/rectum, lymph nodes, spleen, lung, and

                                                                                                                                                                                                                                                     The invention relates to double-stranded oligonucleotides consisting of CC two complementary strands (Ia, Ib), each having 1-5 unpaired nucleotides, CC at either at their 3' and 5' ends, forming single-stranded overhangs. One CC of (Ia) and (Ib) is complementary to a target sequence, (DNA or RNA). CC that is to be specifically repressed. The oligonucleotides are preferably cd double stranded inhibitor RNA molecules with a couple of thymidine bases CC that, when repressed, induce apoptosis, necrosis or differentiation of CC themour cells and/or inhibit division of such cells. Typical of many CC entering the couple of thymidine bases CC alpha transcription factor; sequence encoding various isoforms of the CC vascular endothelial growth factor; viral genes; genes that express a CC chromosomal translocation, e.g. where associated with leukaemia, and CC genes that express androgen receptors; a sequence encoding the Hifl-CC vascular endothelial growth factor; viral genes; genes that express a CC chromosomal translocation, e.g. where associated with leukaemia, and CC genes that express and cc expression of an analy or diagnosis, particularly of CC conditions caused by expression of a harmful gene or fusion protein, CC specifically cancer (e.g. associated with expression of mutant p53 or of CC conditions caused by expression of a harmful gene or fusion protein, CC and rheumatoid arthritis. They may also be used in vitro, e.g. for CC conditions and for establishing a genetic profile, for creating transplants and for establishing a genetic profile, for creating transplants and for establishing a genetic profile, for conditions contain only natural components (so will not induce components; contain only natural components (so will not induce components the human cc effectively than plasmids. This sequence represents the human cc effectively than plasmids. This sequence represents the human cc ells more deficients.
                                                                                                 밁
                                                                                                                                  Ś
                                                                                                                                                                           Matches

                                                                                                                                                                                                                      S
                                                                                                                                                                                                                                                                                                                                                      cc system contains a desired foreign gene in virus-like particles consisting cc of only viral structure proteins, wherein the viral structure protein is capsid protein L1 derived from human papillomavirus(HPV); the foreign gene is associated with immunity; and the foreign gene associated with cc immunity is selected from the group consisting of cytokine gene, cc clal cycle participating gene p21 and angiogenesis inhibitor flk-l. The cc method for producing the gene delivery system containing the desired cc foreign gene comprises the steps of: treating the virus-like particles contained foreign gene into the unit capsomer proteins; adding to react; and removing the reducing agent to refold the unit capsomer corotein. This sequence represents Human papillomavirus type 16 (HPV16) L1 capsid protein DNA.
                                                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                                                                                         Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention describes a gene delivery system containing a desired foreign gene in virus-like particles. The desired foreign gene can be stably delivered into a cell without being decomposed by nucleases and the desired foreign gene also stable in vivo because the virus-like particles do not have nucleic acids derived from virus. The gene delivery

                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention comprises a composition for the detection of cancer markers, the composition contains a nucleic acid molecule which is substantially identical to a full length genomic clone of a human papilloma virus (type 11, 16, 18, 51, 56, 58, 66, 70, or 73). The composition of the invention is useful for diagnosing cancer or the risk of developing cancer, in particular cervical, anal, colon and HPV-related cancer. The present DNA sequence represents a human papilloma virus full length genomic clone of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New composition having a nucleic acid molecule identical to genomic clorof human papilloma virus 16, 18 or 51, useful in diagnosing cancer or the tisk of developing cancer, in particular cervical, anal, colon and HPV-related cancer.

```
The present invention describes a cell (I) comprising pre-trans-splicing compoleules (PTMs) (II) which have one or more target binding domains (IIa) that target binding of PTM to pre-mRNA, 3' splice region (IIb) that coincludes branch point pyrimidine tract and 3'splice acceptor site, or 5' ce spliced to target pre-mRNA, Optionally, that separates RNA splice site (IIc), spacer region (IId) that separates RNA splice site cell comprises; (A) (IIb) and (IIe); or (B) (IIC), (IId) and (IIe). The cell comprises a recombinant vector expressing (II). (I) has cytostatic, cell may comprise a recombinant vector expressing (II). (I) has cytostatic, cell composuppressive and antimicrobial activities, and can be used in gene therapy. (II) comprising one or more (preferably two or more) (IIa) and (IIe), or (II)), (IId) and (IIe), or (II) comprising either (A) or (B) (C) (excluding (IId)), is useful for producing a chimeric RNA molecule in a cell which involves contacting a target pre-mRNA expressed in the cell with (II) that is recognised by nuclear splicing components. The chimeric CRNA produced using (II) which esquences encoding a toxin or translatable comprises nucleotide sequence to be trans-spliced to target pre-mRNA cell produced using (II) which either comprises (A) or (B) further comprises a nucleotide sequence regulator (CFR). The chimeric RNA molecule produced using (II) which either comprises (A) or (B) further comprises and targeted cell death. (I) can be used for gene regulation, of ceremition of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mitchell LG,

                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a the production of an immortalised non-
CC tumourigenic human Schwann or schwannoma cells, introducing a
cell culture of human Schwann or schwannoma cells, introducing a
comprising an exogenous immortalising gene into the cells,
comprising gene and retain phenotypic properties of Schwann or
comprising gene and retain phenotypic properties of Schwann or
comprising cancer chemotherapeution further comprises determining the effect
comprising cancer chemotherapeutic and antineoplastic activity of an agent
comprising cancer chemotherapeutic and antineoplastic activity of an agent
comprising cancer chemotherapeutic and antineoplastic activity of an agent
comprising cancer chemotherapeutic and antineoplastic activity of an agent
comprising the pharmacological agent on schwannomas cells. In the method
comprising an immortalised non-tumourigenic human Schwann or schwannoma
cell line, the polymuclectide is a subgenomic fragment of a virus
consisting of SV40 (Simian Virus 40), adenovirus and human papilloma
comprising the E6 and E7 genes of the human papilloma virus
consisting of types 18, 31, 33 or 35, but preferably 16. The immortalised
non-tumourigenic human Schwann or schwannoma cell line has cytostatic and
compositing of types 18, 31, 33 or 35, but preferably 16. The immortalised
consisting of types 18, 31, 33 or 35, but preferably 16. The immortalised
consisting of types 18, 31, 33 or 35, but preferably 16. The immortalised
constituted is useful for producing an immortalised non-
constitute activity of an agent testing
concer chemotherapeutic and antineoplastic activity of an agent, testing
cancer chemotherapeutic and antineoplastic activity of an agent, testing
concerningenicity of an agent and schwannoma cell line eactivity of
consisting of subject and second concern. This polymuclectice activity of
consisting the disorders and cancer. This polymuclectice activity of
consisting the disorders and cancer. This polymuclectide represents
consisting the disorders and cancer. This polymuclectid

                                                                                                                                                                                                                                                                                                                           8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel method for selective post-translational CC silencing in a mammalian cell of the expression of an exogenous gene of CC viral origin. The method comprises introducing into the cell a small CC interfering RNA (siRNA) construct that is homologous to a part of the RNAA sequence of the gene. The method is useful for the selective post-CC transcriptional silencing of an exogenous gene of viral origin (e.g. an CC compose or human papilloma virus (HPV) gene) in a mammalian cell. The CC method or the siRNA is particularly useful for treating cancer, human CC cervical cancer, human immunodeficiency virus (HIV), smallpox, flu, CC compon cold, or a disease caused by a HPV (e.g. genital warte, cervical CC vilgaris). An siRNA construct or vector is useful for use as a medicament CC for the diseases mentioned. The polynucleotide sequence of the invention CC can be used to treat disorders by gene therapy. This polynucleotide of the invention CC sequence represents the DNA of a HPV siRNA sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                    Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method and composition comprising a transfer agent and a solid or colloidal carrier medium for delivering biological agents into cells. The invention is useful for the treatment of cancer, tumor, carcinoma of cutaneous, squamous or cervical epithelia and colorectal carcinoma, wounds, burns and scars. The invention is also useful in gene therapy. The present sequence is the human papillomavirus type 16 86/87 gene fragment. This sequence is useful in a method for treating carcinomas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Composition useful for delivering an agent into a cell comprises the agent, a transfer agent and a solid or colloidal carrier medium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 25-NOV-2003; 2003GB-00027409.

The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive exercise are cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    E6 protein; E7 protein; fusion protein; HPV16; HPV-associated cancer; cervical cancer; immune response; lower gastrointestinal tract cancer; anal cancer; reproductive system cancer; penile cancer; vulvar cancer;
                                                                                                                                                                                                   New polypeptide comprising human papillomavirus E6 and useful for treating or preventing human papillomavirus cancers, e.g. cervical cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human papillomavirus type 16 Synthetic.

The present sequence encodes a fusion protein, polypeptides from human papillomavirus type 16 protein is designated E6E7PentM, and comprises

comprising E6 and E7 (HPV16). The fusion an E6 amino terminus

₽7

New polypeptide comprising human papillomavirus E6 and E7 polypeptides, useful for treating or preventing human papillomavirus (HPV)-associated cancers, e.g. cervical cancer.

The present sequence encodes an E6E7 fusion protein, comprising wild type E6 and E7 polypeptides from human papillomavirus type 16 (HPV16). The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in AD044072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (where residues 63 and 106 have been replaced with glycine) and an E7 carboxy terminus (where residues 24, 26 and 91 have been replaced with glycine). E6E7PentM is representative of fusion proteins of the invention. The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E6 polypeptide has no mutations or has

specification describes human papillomavirus 86 and 87 polypeptides, where the 87 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in ADO44073 and the 86 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for treating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     primer: T3 ET from Amersham.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   5'-aggactegtaacaacggagtacttt-ttttttttttvn-3'. cDNA was subsequently amplified in a 7-cycle PCR with the following primers: 5'-ggccgctaatacgactcactatag-3'
5'-agcagtegt-aacaacgcag. Deoxy-UMP adaptors were added in a third PCR (5 cycles) and the primers
5'-caucaucaucaucaucagccgctaatacgactcactataggg-3' and 5'-cuaucaucaucaucagccgctaatacgactcactataggg-3' and 5'-cuaucaucaucaucaucagtcggtacaacaacgcagagtac-3'. Ends were treated with uracil DNA glycosylase and product with 3' overhangs was annealed to complementary ends of pAMP1. Insert can be excised using EcoRI and NotI. Library constructed by Joe Barnes and Steve Johnson (Washington University)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /tissue_type="embryo, 14 somite"

Olsaker,I. and Laerdahl,J.K.

Production of ESTs from a cDNA library of flushed bovine preimplantation embryos

Unpublished (2005)
                                    Email: ingrid.olsaker@veths.no
Single pass sequencing. Bases called and trimmed with Phred. Vector
pCMV-PCR identified with cross_match. EST name is Clone.g-T7
                                                                                                       Contact: Olsaker, I.
